The QuickStep motor. Step motors with integrated driver MIS231, MIS232, MIS234

The QuickStep series of Stepper motors with integrated electronics represents a major step forward. All the necessary electronics in a stepper system are integrated in the motor itself.

In the past, a traditional motor system has typically been based on a central controller unit located remote from the motor. This configuration however has the negative effect that installation costs are a major part of the total expense of building machinery.

The basic idea of the QuickStep motors is to minimize these costs but also to make a component that is much better protected against electrical noise which can be a typical problem when using long cables between the controller and motor.

The stepper motor, encoder and electronics are specially developed by JVL so that together they form a closed unit in which the power driver and controller are mounted inside the motor in a closed section.

The advantages of this solution are:

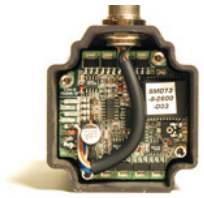
- De-central intelligence.
- Simple installation. No cables between motor and driver.
- EMC safe. Switching noise remains within motor.
- Compact. Does not take space in cabinet.
- 12-48VDC power.
- Low-cost alternative to separate step or servo motor and driver.

Interface possibilities to the QuickStep motor:

- From PC/PLC with serial commands via RS485.
- Pulse/direction input. Encoder output.
- Option for µPLC built-in with grafical programming.
- CANopen, DeviceNet
- 8 I/O, 5-28VDC that can be configured to Inputs, Outputs or analogue inputs
- Future option for Profibus DP, Ethernet, Bluetooth and Zigbee wireless

Quickstep is a new series of motors from JVL which can be delivered with a large selection of functions and in a wide variety of combinations. The base is a hightorque NEMA23 step motor with a housing so that IP55 or larger protection can be achieved. One or more circuit cards and different connectors can be mounted in the housing to adapt the motor to a given task.
Also available: Step motor without electronics. Optional with encoder.
All modules can be delivered with M12, cable glands or, by larger orders, connector chosen by customer.
1,1Nm, 1,6Nm or 2,9Nm versions
Backlash free and planetary gears in ratios of 3, 5, 10, 20, 100 can be delivered from stock.

Pulse/direction



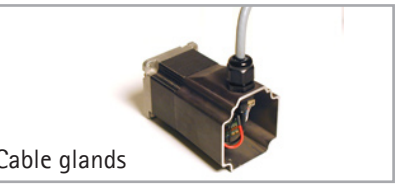
- Pulse/direction driver
- 200, 400, 800, 1000 or 1600 pulse/rev. resolutions.
- Input for pulse/direction signal 5-24VDC PNP/NPN.
- The driver is the wellknown SMD73.
- Supply voltage is 12 - 28VDC
- Can also be delivered as box driver without motor.

Positioning or Speed Control

- Serial RS485 or 5V serial position controller
- Position controller with grafic programming, Canbus, CANopen 402 or DeviceNet
- Stall detect by means of magnetic encoder with resolution of up to 1024 pulses/rev.
- A double supply facility is available so that position and parameters are maintained at emergency stop
- Gear mode
- MACmotor protocol so MACmotor and Quickstep motors can be connected on the same RS485 bus
- Command for easy PLC/PC setup and communication
- Power supply 12-48VDC
- Fixed 1600 pulses/rev.
- Can also be delivered as box controller without motor.

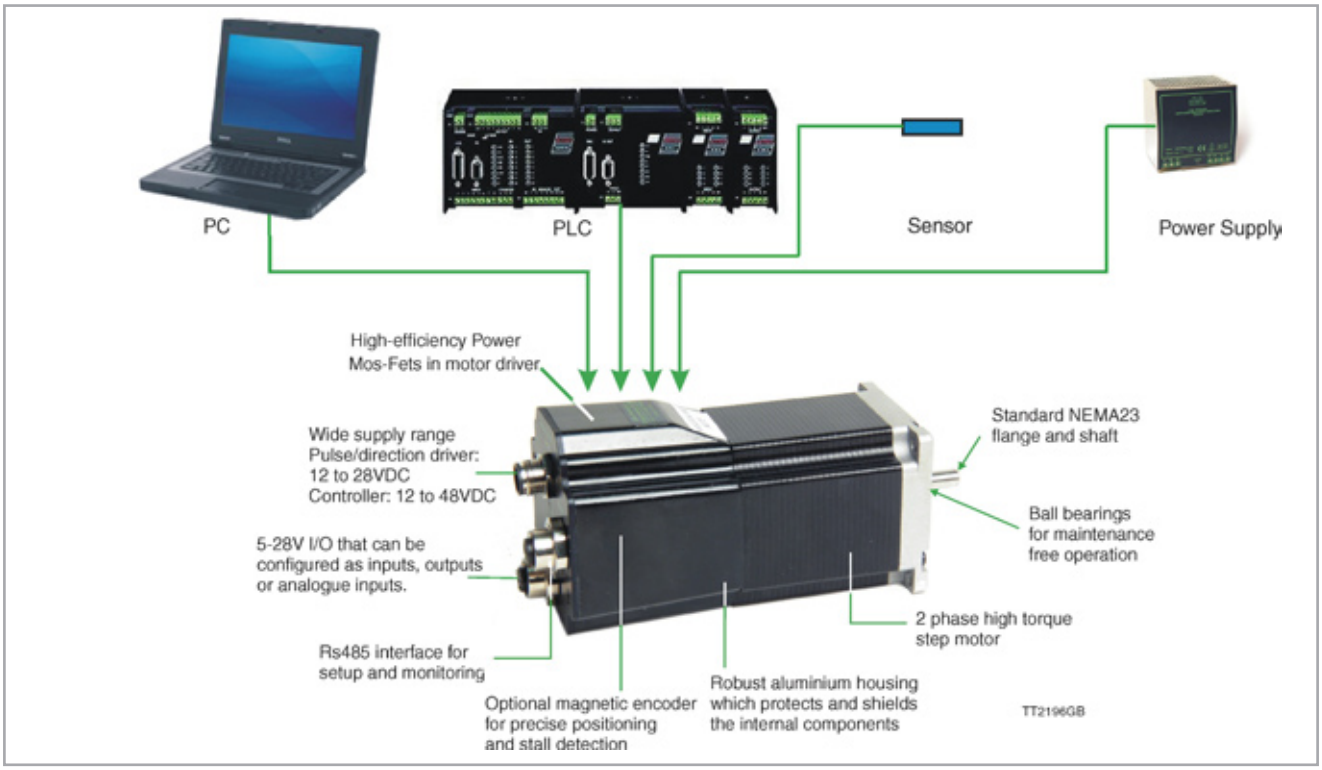
Built-in µprocessor with 8 In/Out that can be configured as inputs, PNP outputs or analogue inputs. RS485 interface for set up and programming. Option for CANbus, CANopen 402 or Devicenet. Driver technology is improved as compared to SMD73 and supply voltage is 12-48VDC.

M12 Connector



Cable glands

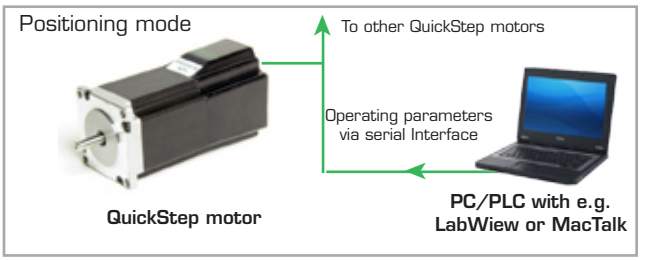
System and Feature Overview



Modes of Operation

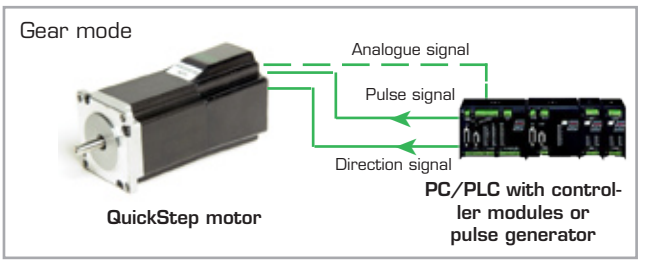
Positioning and Velocity Mode

In this mode the QuickStep motor positions the motor via commands sent over the serial interface. Various operating parameters can be changed continuously while the motor is running. This mode of operation is used primarily in systems where the Controller is permanently connected to a PC/PLC via the interface. This mode is also well suited for setting up and testing systems. The mode is also used when programming is made.



Gear Mode

In this mode the QuickStep motor functions as in a step motor driver. The motor moves one step each time a voltage pulse is applied to the step-pulse input. Velocity, acceleration and deceleration are determined by the external frequency, but can be limited and controlled by the QuickStep motor. In addition, the QuickStep motor also provides a facility for electronic gearing at a keyed-in ratio.



Serial Mode

In this mode the QuickStep motor's registers contain the positions, velocities, accelerations, etc., required for the actual system. The registers can be selected and executed by a single byte sent via the serial interface. This mode provides maximum utilisation of the QuickStep motor's features since the QuickStep motor itself takes care of the entire positioning sequence.

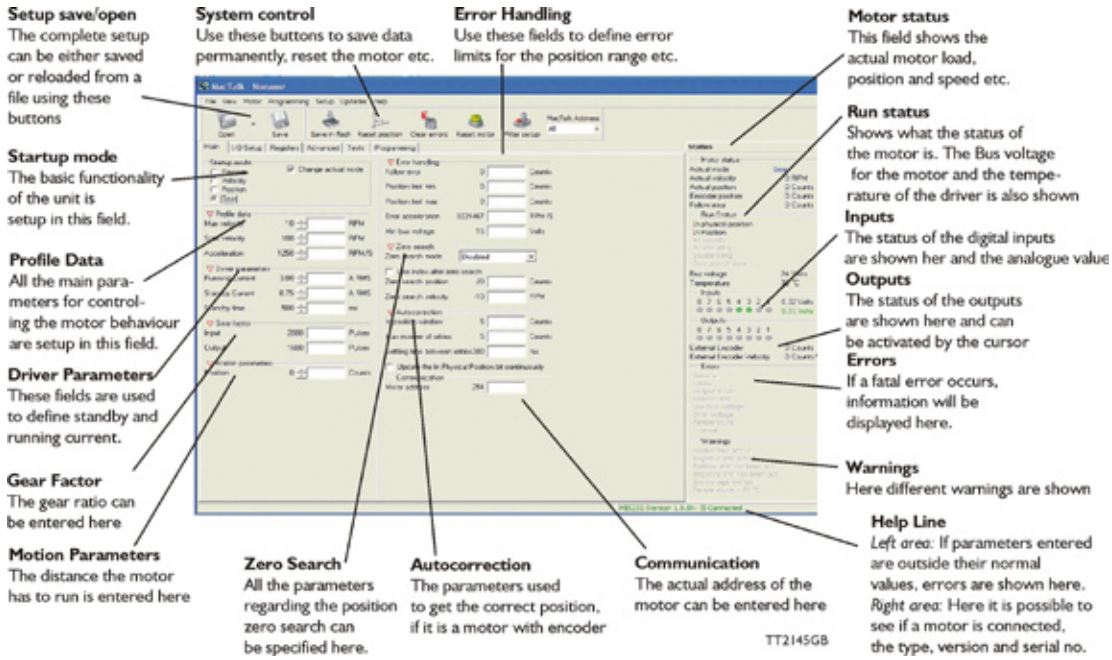
Setup and programming with software MacTalk



MacTalk introduction

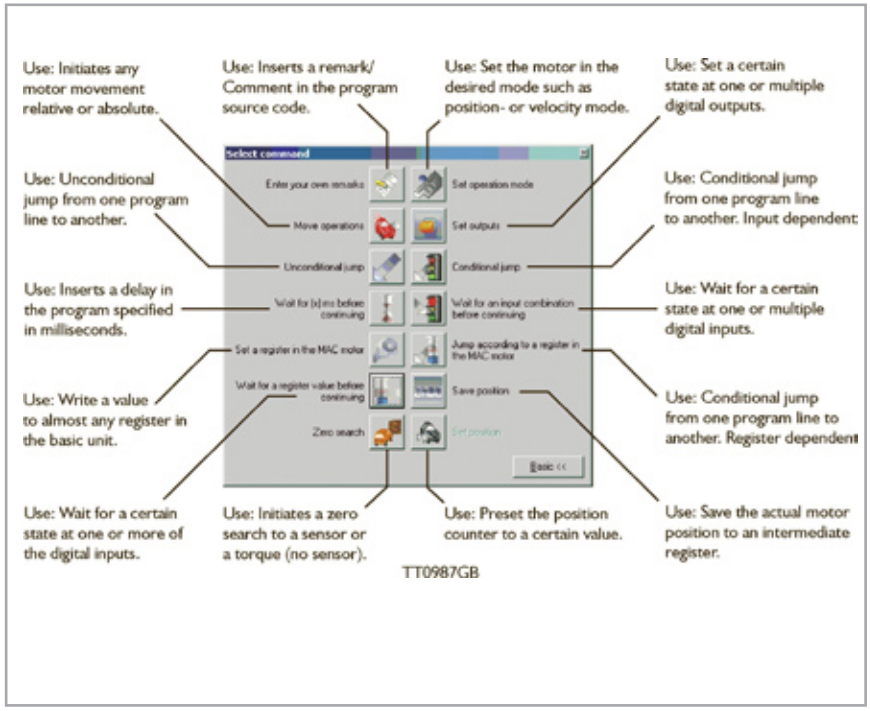
The MacTalk software is the main interface for setting up the QuickStep motor for a specific application.
The program offers the following features:

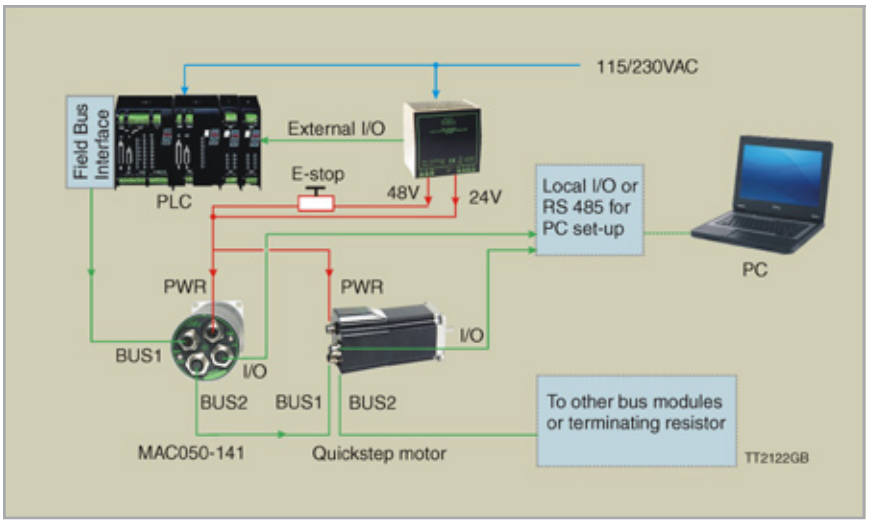
- Choice of the operating mode of the QuickStep motor.
- Changing main parameters such as speed, motor current, zero search type, etc.
- Monitoring the actual motor parameters in real time, such as supply voltage, input status, etc.
- Changing protection limits such as position limits.
- Saving all current parameters to disc.
- Restoring all parameters from disc.
- Saving all parameters permanently in the motor.
- Updating the motor firmware or MacTalk software from the internet or a file.

The main window of the program changes according to the selected mode, thus only showing the relevant parameters for operation in the selected mode.

Command toolbox description

The toolbox used for the programming covers 14 different command types.
The idea for the commands - is to have an easy access to the most common functions in the motor. Some functions seems to be missing by the first sight but the botton "Set register in the QuickStep motor" or "Wait for a register value before continueing" gives direct access to +50 registers down in the basic QuickStep motor such as the gear ratio or the actual torque register.
In total this gives a very power full programming tool since >95% of a typical program can be build using the simple command icons and the last part is optained by accessing the basic motor registers directly.
Below is a short description of all 14 command icons.





Quickstep and MAC motor in an RS485 or CANbus network
